

Name, Surname:

You can add print screens. Make answers understandable for me.

Note: After finishing tasks change file name to “Linux_env_Yourname_Yoursurname.docx”

Task1.

1. Imagine you are writing bash script. You have an if condition. You need to check if last command run successfully? How do you check it?
2. Set value 11 for variable a temporary for session.
3. Set color blue for one session
4. Open another terminal and check those variables? What are results? Write down commands and results.
5. Set mydata=/opt/mydata variable globally for all users.
6. What command did you run after changing file?
7. Which files are for user's environment variables?
8. Which files are for all user's environment variables?
9. Which variable will set for user if one variable set in both files.

Name=alibaba -- set globally

Name=aliexpress -- set only for user.

Which result will you see when you check

Echo \$Name

10. How do you look all the environment variables for user? Write down command.
11. Add new user with name apple. Set password.

#useradd apple

#passwd apple

- a. Login with user apple
- b. Set environment variable permanently only for that user. JAVA_HOME=/usr/java/java_11 (create folders)
- c. Change PATH variable. Add new java path to PATH variable.

Add that “/usr/java/java_11/bin” path to PATH variable. For apple user.

- d. Run \$which java. It should find under “/usr/java/java_11/bin”

Task 2.

1. What is inode?
2. There is dd command in linux. Create new empty file with that command.with size 100MB. Make 5 hard link of that file. Write down ls -li result.
3.
 - a. Now there are 5 files with same inode. How much size does they take in hard drive?
 - b. What happens to hard links if you delete original file?
 - c. Which information are kept in inode?
 - d. Can you create hard link of file in different disks?
 - e. Make hard link of any file under /boot folder in opt folder. What happened and why?
 - f. Create some soft links of files and delete original file. What happened?
