

In CentOS or any Linux-based operating system, double quotes (" "), single quotes (' '), and backticks (`) have specific meanings and usages in the command line and shell scripting:

Double Quotes (" "):

Double quotes are used to define a string in which variables and special characters are expanded. This means that if you enclose a variable within double quotes, its value will be substituted.

```
name="John"
echo "Hello, $name!"
```

Output: Hello, John!

For

example:

Single Quotes (' '):

Single quotes are used to define a string in which everything enclosed within them is treated as a literal string. Variables and special characters within single quotes are not expanded.

```
name="John"
echo 'Hello, $name!'
```

Output: Hello, \$name!

For

example:

Backticks (` `):

Backticks are used for command substitution. When you enclose a command within backticks, the command is executed, and its output is substituted into the surrounding expression.

```
current_date='date'
echo "The current date is: $current_date"
```

Output: The current date is: <current date and time>

For

example:
