

Name_Surname:

1. Create repository from mounted local cdrom. Do not copy config from somewhere, do it from your mind ☺
Mount olunmuş lokal cdrom-dan repository yarat. Heç bir yerdən kopyalamadan edin.
2. Check if repo which you created is working normally. How did you check that?
Reponun işləməyini yoxlayın.
3. Check if httpd service package is installed. How?
Httpd paketinin yüklənib yüklənmədiyini yoxlayın.
4. If httpd is installed remove it. If not, install it from !!!LOCAL REPOSITORY and then remove it. How??
Əgər yüklənibsə silin sonra yenidən local repodan yazın. Yenidən silin.
5. Imagine that you need to run netstat command but when you run it it gives back COMMAND NOT FOUND. So you need to install package but you don't know which package? How will you find it?
Netstat komandasını tapa bilməyəndə onun hansı paket altında olduğunu necə tapırıq?
6. List ALL!!! group packages?
7. Install any packages group. Example "web server"
8. Install docker on RHEL9. To do that you need to create a docker yum repository and then remove some rpms from system. First google it ☺
Docker-l install edin.
9. Undo last yum process
10. What is repository?
11. What is dependency? And dependency hell.
